

1: Daytime Scoping Survey – can be undertaken at any time of year. Assesses presence of droppings or other signs, can assess the potential of bat presence on a negligible, low, moderate or high scale.

2: Dusk Emergence or Dawn Return Surveys – can be undertaken May to August (occasionally April to September). Generally conclusive of bat presence however more labour intensive.

3: Licences- These require a detailed method statement of work, require full planning permission to be in place and will require additional time on site by a licensed bat worker supervising demolition.

All elements of the three stage approach are subject to separate costs. Please contact us for details
